29

30 **SI Table 3 Percentage representation of the antennal CHC amount for Fig. 5**

31 Each GC peak is represented as a percentage of the total of 29 hydrocarbons. The peak numbers  
 32 correspond to the CHCs identified by Jurenka et al. (1989). Peak 15 (9-, 11-, 13-, and 15-  
 33 methylnonacosane) is known as a male-enriched CHC, and peak 22 (3,7-, 3,9-, and 3,11-  
 34 dimethylnonacosane) is a female-enriched CHC. 3,11-Dimethylnonacosane also serves as precursor to  
 35 several components of the female contact sex pheromone.

## Behavioral observations

## Chemical analysis of cuticular hydrocarbons

## Bioassay of wing-raising courtship display

83 **SI Figure 1.** Time-course of various experiments.  
84 A, Locomotor activity and grooming frequency for Fig. 1. B and C, Chemical analysis of  
85 cuticular hydrocarbons (CHCs) for Figs. 2 and 3. D–F, Bioassays of wing-raising displays for  
86 Fig. 4–7. The purpose of the 24 hrs starvation period applied to donors in E–F (experimental  
87 Day0 to Day1) is to allow the donor insects to excrete feces during the starvation period, to  
88 prevent the recipients from receiving fecal contamination from the donors during the 24 hrs of  
89 co-habitation (conditioning; Day1 to Day2).  
90

91 **SI Video 1.** Context of the wing-raising (WR) display of male *B. germanica*.  
92 The video shows the WR response of a male to an isolated female antenna in the “antenna-on-a-  
93 stick” assay. The male shows WR responses upon stimulation with only a female antenna,  
94 because a contact sex pheromone is contained in the female’s cuticular lipids.
